# BE Study Designs

• Currently no two-stage design if
 

- >2 formulations
- Replicate design

 • Futility rules (e.g., maximum sample size) in TSDs problematic.

# Add-on / Two-Stage Designs

- Sometimes properly designed and executed studies fail due to
  - 'true' bioinequivalence,
  - poor study conduct (increasing variability),
  - pure chance (producer's risk hit),
  - false (mainly over-optimistic) assumptions about the CV and/or T/R-ratio.
- The patient's risk must be preserved
  - Already noticed at Bio-International Conferences (1989, 1992) and guidelines from the 1990s.

# Sequential Designs

- Have a long and accepted tradition in clinical research (mainly phase III)
  - Based on work by Armitage *et al.* (1969), McPherson (1974), Pocock (1977), O'Brien and Fleming (1979), Lan and DeMets (1983), ...
    - First proposal by Gould (1995) in the field of BE did not get regulatory acceptance in Europe, but
    - new methods stated in recent guidelines.

AL Gould

*Group Sequential Extension of a Standard Bioequivalence Testing Procedure*

*J Pharmacokin Biopharm* 23(1), 57–86 (1995)

DOI: [10.1007/BF02353786](https://doi.org/10.1007/BF02353786)

# Sequential Designs

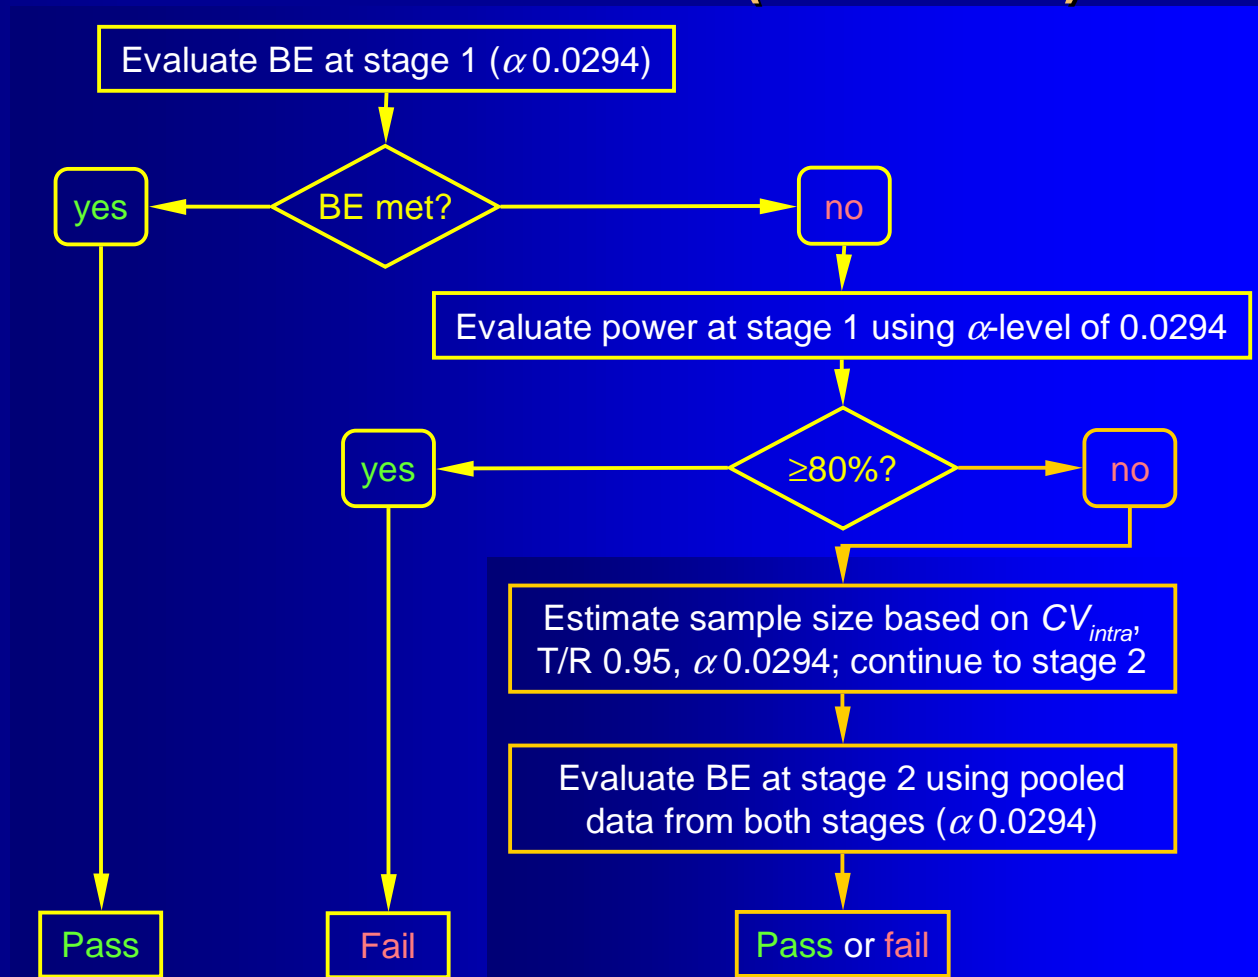

- **Methods by Potvin *et al.* (2008) first validated framework in the context of BE**
  - **Supported by the ‘Product Quality Research Institute’ (members: FDA/CDER, Health Canada, USP, AAPS, PhRMA...)**
    - **Three of BEBAC’s protocols accepted by German BfArM, first product approved in 06/2011.**

*Sequential design approaches for bioequivalence studies with crossover designs*  
*Pharmaceut Statist* 7(4), 245–62 (2008) DOI: [10.1002/pst.294](https://doi.org/10.1002/pst.294)

# Review of Guidelines

- **EMA (Jan 2010)**  
Acceptable; Potvin *et al.* Method B preferred (?)
- **Canada (May 2012)**  
Potvin *et al.* Method C recommended
- **FDA (Jun 2012)**  
Potvin *et al.* Method C/D recommended  
API specific guidances: Loteprednol, (Dexamethasone / Tobramycin)
- **Russia (2013)**  
Acceptable; Potvin *et al.* Method B preferred (?)

Sample size penalty (CV 14–40%, 80% power)

# Potvin *et al.* (Method B)

## ● Technical Aspects

- Only *one* Interim Analysis (after stage 1).
- Use software (wide step sizes in Diletti's tables); preferably the exact method (avoid approximations).
- Should be termed 'Interim Power Analysis' *not* 'Bioequivalence Assessment' in the protocol.
- No *a posteriori* Power – only a validated method in the decision tree.
- No adjustment for T/R observed in stage 1 (not fully adaptive).

## Potvin *et al.* (Method B)

### ● Technical Aspects (cont'd)

- No futility rule preventing to go into stage 2 with a very high sample size!

Must be clearly stated in the protocol (unfamiliar to the IEC because common in Phase III).

- Pocock's  $\alpha 0.0294$  is used in stage 1 and in the pooled analysis (data from stages 1 + 2),  
*i.e.*, the  $1 - 2 \times \alpha = 94.12\%$  CI is calculated.
- Overall patient's risk preserved at  $\leq 0.05$ .

# Potvin *et al.* (Method B)

## ● Technical Aspects (cont'd) + EMA modification

- If the study is stopped after stage 1, the statistical model is:

`fixed: sequence + period + treatment  
+ subject(sequence)`

- If the study continues to stage 2, the model for the combined analysis is:

`fixed: stage + sequence + sequence(stage)  
+ subject(sequence × stage) + period(stage)  
+ treatment`

- No poolability criterion! Combining is *always allowed* – even if a significant difference between stages is observed. No need to test this effect.

# Potvin *et al.* (Method B)

- **Technical Aspects (cont'd) + EMA modification**
  - Incomprehensible why this modification was introduced by EMA's Biostatistical Working Party
    - Simulations performed or "gut feeling"?
      - Modification shown to be irrelevant.
      - Furthermore no difference whether subjects were treated as a fixed or random term (*unless*  $T/R > 1.20$ ).

Karalis V and P Macheras

*On the Statistical Model of the Two-Stage Designs in Bioequivalence Assessment*

J Pharm Pharmacol 66(1), 48–52 (2014) DOI: [10.1111/jphp.12164](https://doi.org/10.1111/jphp.12164)

# Potvin *et al.* (Method B)

## ● Technical Aspects (cont'd)

- Potvin *et al.* used a simple approximative power estimation based on the shifted central *t*-distribution.
- If possible use the exact method (Owen; *R* package *PowerTOST* method = 'exact') or at least one based on the noncentral *t*-distribution (*PowerTOST* method = 'noncentral').
- Power obtained in stage 1 (example 2 from Potvin):

method	% power
approx. (shifted centr. <i>t</i> )	50.49
approx. (noncentral <i>t</i> )	52.16
exact (Owen's <i>Q</i> )	52.51

# Example (Potvin Method B)

## Model Specification and User Settings

# Potvin *et al.* (Method C)

# Potvin *et al.* (Method C)

1150 · 10<sup>6</sup> Sim's (Method C)

# Potvin *et al.* (Method B vs. C)

## ● Pros & cons

- Method C (*if power  $\geq 80\%$* ) is a conventional BE study; no penalty in terms of  $\alpha$  needs to be applied.
- Method C proceeds to stage 2 less often and has smaller average total sample sizes than Method B for cases where the initial sample size is reason-able for the CV.
- If the size of stage 1 is low for the actual CV both methods proceed to stage 2 almost all the time; total sample sizes are similar.
- Method B slightly more conservative than C.

# Potvin *et al.* (Method B vs. C)

## ● Recommendations

- Method C/D preferred due to slightly higher power than method B (FDA, HPFB). Method B for EMA (?)
- Plan the study *as if* the CV is known
  - If assumptions turn out to be true = no penalty
  - If lower power (CV higher than expected), BE still possible in first stage (penalty; 94.12% CI) or continue to stage 2 as a 'safety net'.
- Don't jeopardize! Smaller sample sizes in the first stage than in a fixed design don't pay off.  
Total sample sizes are ~10–20% higher.

# TSDs: Alternatives

- Methods by Potvin *et al.* (2008) limited to T/R of 0.95 and 80% power
  - Follow-up publications (T/R 0.95...0.90, 80...90% power)

reference	method	T/R	target power	CV	$\alpha_{adj.}$	max. $\alpha_{emp.}$
Potvin <i>et al.</i>	B	0.95	80%	10–100%	0.0294	0.0485
	C	0.95				0.0510
Montague <i>et al.</i>	D	0.90			0.0280	0.0518
Fuglsang	B	0.95	90%	10–80%	0.0284	0.0501

# Karalis & Macheras (Expl. a)

- CV assumed as 20%, T/R 95%
  - In a fixed sample design for 80% power sample sizes would be 20 ( $\alpha 0.05$ ) or 24 ( $\alpha 0.0294$ ).
  - The sponsor chooses  $n_1$  24 and UL 100.
  - $10^6$  simulations (Potvin C),  $10^5$  (K & M)

method	(overall) power	power (stage 1)	% studies to stage 2	$n_{95\%}$
Potvin <i>et al.</i>	90.1	88.1	4.2	24
Karalis & Macheras	94.8	83.5	11.4	66

- ~Three times as many studies forced to stage 2 with a high probability of large sample sizes.

# Karalis & Macheras (Expl. b)

- CV assumed as 40%, T/R 95%
  - Fixed sample design n 66 ( $\alpha$  0.05) or 80 ( $\alpha$  0.0294).
  - The sponsor chooses  $n_1$  60 and UL 150.
  - $10^6$  simulations (Potvin C),  $10^5$  (K & M)

method	(overall) power	power (stage 1)	% studies to stage 2	$n_{95\%}$
Potvin <i>et al.</i>	83.6	69.7	23.8	98
Karalis & Macheras	74.2	67.2	7.2	130

- Power <80%; only  $\sim 1/3$  of studies proceed to stage 2, although with considerably larger sample sizes.

Labes D and H Schütz

*An Insight into the Properties of a Two-Stage Design in Bioequivalence Studies: A Rejoinder*  
 Pharm Res (submitted 2013)

# Futility Rules revised

- **EMA GL Section 4.1.8 ‘Two-stage design’**  
*“[...] the stopping criteria should be clearly defined prior to the study.”*
  - **What does that mean?**
    - **Failing in stage 1 or the pooled analysis according to the chosen method.**  
→ Part of the validated frameworks.
    - **Early stopping for futility (e.g., ‘bad’ ratio, extreme stage 2 sample size caused by high CV – better to opt for reference-scaling...).**  
→ Not validated. A misunderstanding by regulators (stopping criterion  $\neq$  futility rule).

# Futility Rules revised

- Introduction of a futility rule does not inflate the patient's risk, but power may drop substantially!
  - State stopping criteria unambiguously in the protocol.
  - If you want to introduce a futility rule, simulations are mandatory in order to maintain sufficient power.

*“Introduction of [...] futility rules may severely impact power in trials with sequential designs and under some circumstances such trials might be unethical.”*

A Fuglsang

*Futility Rules in Bioequivalence Trials with Sequential Designs*

APPS J 16(19), 79–82 (2014) DOI: [10.1208/s12248-013-9540-0](https://doi.org/10.1208/s12248-013-9540-0)

# Advanced Example

- 'Must pass' BE in stage 1 (first to file)
  - Fixed T/R 90% (pessimistic; very likely better)
  - Expected CV 20% (pilot study with two references)
  - ~30% expected drop-out rate; start with 88 to have  $n_1 \geq 60$
  - Targets
    - >90% power for  $n_1$  60 – even for extreme CV of 45%
    - 90% power for  $n_1 \geq 60$  (CV 20%) in stage 1
    - Not <80% power for CV  $\geq 25\%$  in stage 1
    - Low probability to proceed to stage 2

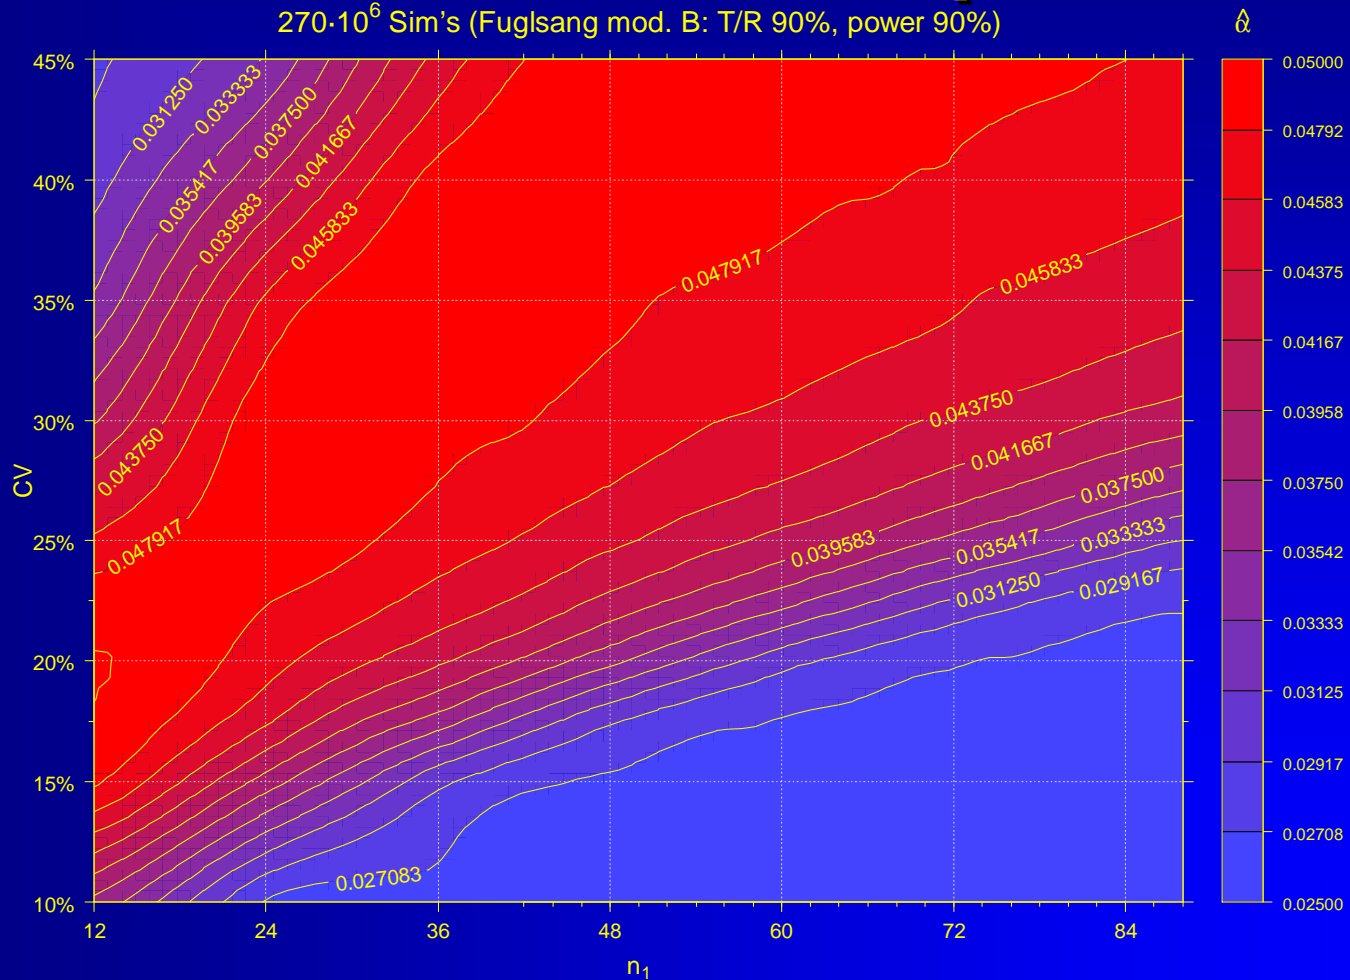

# Advanced Example

- 'Must pass' BE in stage 1 (first to file)
  - Sponsor preferred Method B (EU submission...)
  - Fuglsang published  $\alpha_{adj}$  0.0269 for T/R 0.90 and 90% power – but only for Method C...
  - Same  $\alpha_{adj}$  applicable?
  - Likely...
    - Potvin *et al.* showed less inflation with Method B.
    - Fuglsang needed less adjustment in Method B.
    - But we have to justify that!
  - $10^6$  sim's for  $\alpha$  and  $10^5$  for power.  
Thanks to Detlew Labes for R package *Power2Stage*!

# Advanced Example

270·10<sup>6</sup> Sim's (Fuglsang mod. B: T/R 90%, power 90%)

# Advanced Example

- 'Must pass' BE in stage 1 (first to file)
  - Targets met
    - 93% power for  $n_1$  60 (CV 20%) and 90% for extreme CV of 45%
    - 90% power for  $n_1 \geq 60$  (CV 20%) in stage 1
    - Low chances to proceed to stage 2 with CV 20%:  
 $n_1$  60: 6%,  $n_1$  72: 1%
    - $\geq 80\%$  power for  $CV \geq 20\%$ , even for a more extreme drop-out rate
    - $\alpha_{adj}$  0.0271 would work as well (with  $0.0278 < 0.052$ )
  - Study passed in the first stage (February 2014)

# TSDs: Parallel Design

## ● A Fuglsang (2014)

- Based on Potvin's Methods B/C ( $\alpha_{adj.}$  0.0294, 80% power)
- Framework:  $n_1$  48–120, CV 10–100%
- Explored
  - equal and unequal variances of groups
  - conventional  $t$ -test and Welch-Satterthwaite approximation
- Results
  - No significant  $\alpha$ -inflation
  - Power  $\geq 78.4\%$

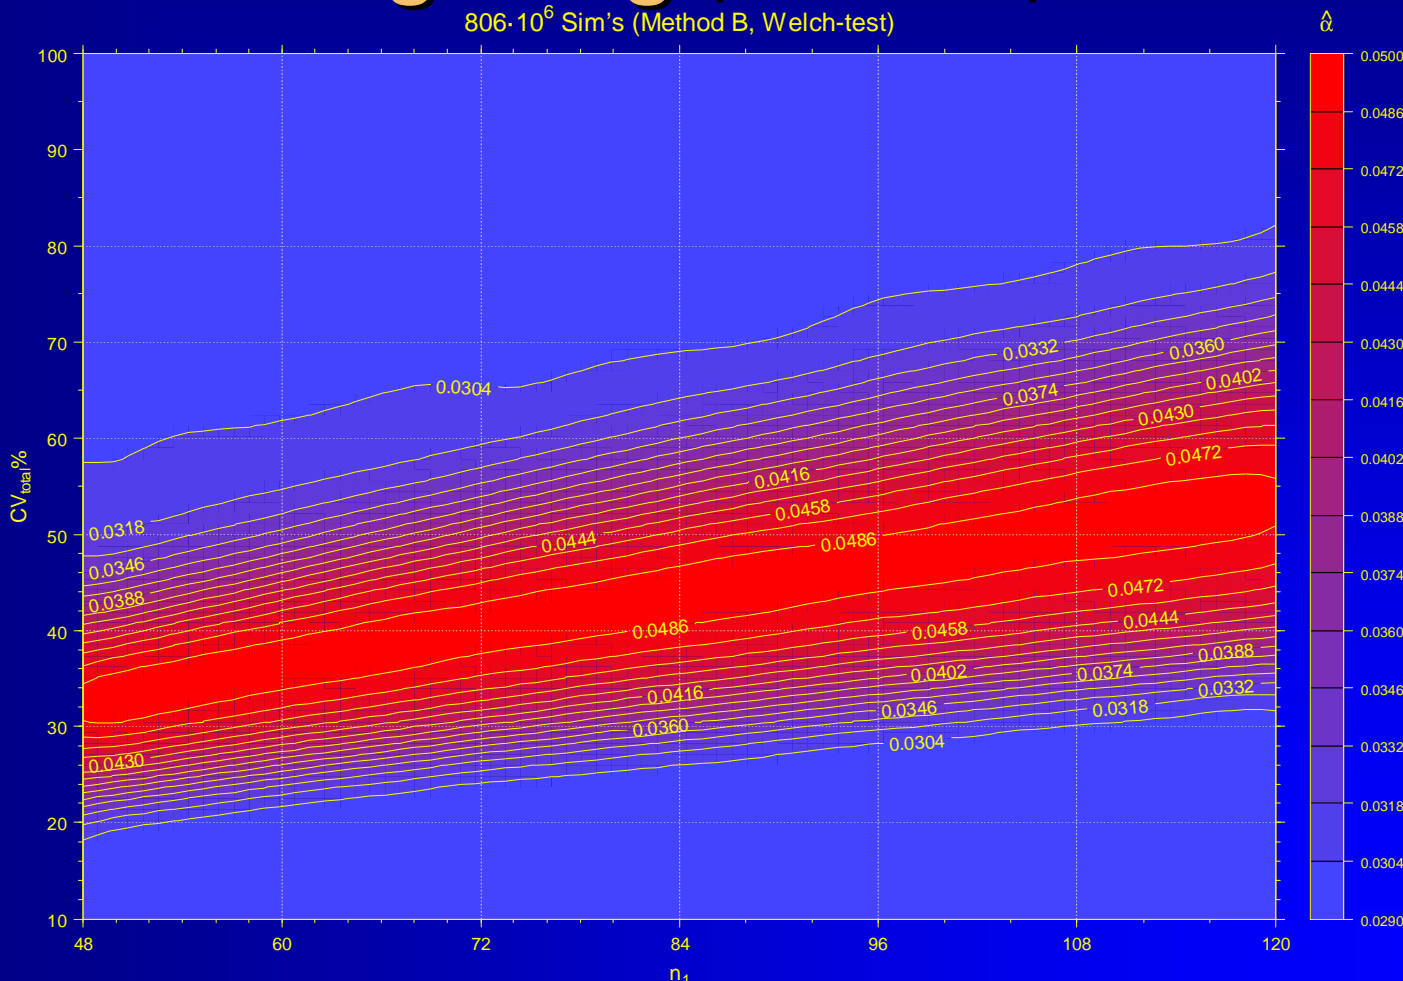

A Fuglsang

*Sequential Bioequivalence Approaches for Parallel Designs*

AAPS J, Epub ahead of print (Feb 2014), DOI: [10.1208/s12248-014-9571-1](https://doi.org/10.1208/s12248-014-9571-1)

# Fuglsang (Method B)

806 · 10<sup>6</sup> Sim's (Method B, Welch-test)

# Fuglsang (Method B)

80.6 · 10<sup>6</sup> Sim's (Method B, Welch-test)

# Case Study 1 (EMA)

- **Method C: Study passed BE in stage 1 (49 subjects, CV 30.65%, 90% CI)**
  - **UK/Ireland: Unadjusted  $\alpha$  in stage 1 not acceptable.**
    - Study passed BE with 94.12% CI as well (*post hoc* switch to Method B).
  - **Austria: The Applicant should demonstrate that the type I error inflation, which can be expected from the chosen approach, did not impact on the decision of bioequivalence.**
    - One million simulations based on the study's sample size and CV.  
 $\alpha_{emp}$  0.0494 (95% CI: 0.0490 – 0.0498)

## Case Study 2 (EMA)

- **Method C: Study stopped in stage 1**
  - AUC power >80%: passed BE with 90% CI
  - $C_{\max}$  power <80%: passed BE with 94.12% CI
    - **The Netherlands: Adapting the confidence intervals based upon power is not acceptable** and also not in accordance with the EMA guideline. **Confidence intervals should be selected *a priori*, without evaluation of the power.** Therefore, the applicant should submit the 94.12% confidence intervals for AUC.
      - AUC fails BE with 94.12% CI
      - Sponsor repeated the study with a very (!) large sample size and failed on  $C_{\max}$ . Project cancelled.

## Case Study 3 (EMA)

- **Method C: Two studies passed in stage 1**  
(n=15 SD, n=16 MD,  $C_{max}$  CV 17.93%, 8.54%, 90% CIs)
- **Would have passed with Method B as well; however, 94.12% CIs were not reported.**
  - **RMS Germany.** Accepted by CMSs **Austria, Denmark, Sweden, and The Netherlands.**
  - **Spain: Statistical analysis should be GLM.** Please justify.
    - Evaluated with all-fixed effects model.  
Both studies passed.  
Issue resolved (September 2013)

# Outlook

- Feasibility / futility rules.
- Arbitrary expected T/R and/or power.
- Methods without interim power.
- Dropping a candidate formulation from a higher-order cross-over; continue with 2×2.
- Full adaptive methods.
- Exact method (not depending on simulations).
- Application to replicate designs / scaling.

# Don't panic!

conventional 2x2 cross-over (fixed sample design)
